Sample Fluid Power Practice Problems with Answers

Problem 1: Hydraulic Force Calculation

Given: A hydraulic cylinder has a piston diameter of 4 inches. The system operates at a pressure of 1500 psi.

Question: What is the force exerted by the cylinder?

Solution:

- Convert diameter to radius:

Radius (r) = 4 inches / 2 = 2 inches

- Calculate the area (A):

$A = \pi r^2 = \pi \times (2)^2 = 12.57 \text{ in}^2$

- Use the formula for force:

Answer: The hydraulic cylinder exerts approximately 18,855 pounds of force.

Problem 2: Flow Rate in Pneumatic System

Given: A pneumatic system has a compressor delivering air at a pressure of 100 psi and a flow rate of 10 CFM (cubic feet per minute).

Question: How much air volume flows through the system per minute?

Solution:

Since flow rate is directly given:

Flow rate = 10 CFM

Answer: The system delivers 10 cubic feet of air per minute.

Problem 3: System Efficiency

Given: A hydraulic system consumes 200 Watts of power but produces a useful work output of 150 Watts.

Question: What is the efficiency of the system?

Solution:

Efficiency (\(\eta\)) is calculated as:
