- **Draw a clear diagram:** Accurate diagrams are crucial for understanding relationships and applying theorems.
- **List known facts and theorems:** Recall relevant properties or theorems that can be applied.
- **Apply suitable methods:** Use geometric theorems, algebraic formulas, or coordinate methods as appropriate.
- **Verify your answers:** Check if the solution satisfies all conditions and makes sense within the context.

Below, we explore common types of problems from pages 347 to 355 and demonstrate how to solve them.

Typical Problems and Solutions from Pages 347 to 355

Problem Type 1: Finding Lengths of Tangents and Secants

Sample Problem:

In a circle with center O, two tangents AB and AC are drawn from an external point A. If the length of AB is 8 cm and the length of AC is 6 cm, find the length of the segment from A to the point where the secant intersects the circle.

Solution Approach:

- Recall that tangents from a common external point are equal in length, so AB = AC = 8 cm (assuming the problem states this).
- Use the Power of a Point theorem:

$$
\text{Power of point A} = \text{tangent}^2 = \text{secant segment} \times \text{external segment}
$$

- If we know the length of the tangent, and the secant segment's external part, we can set up an equation to find the unknown.

Step-by-Step Solution:

- Since both tangents are equal, AB = AC = 8 cm.
- Suppose the secant intersects the circle at points D and E, with A outside the circle.
- Applying the Power of a Point theorem:

\[

AB^2 = AD \times AE

\]

- If the external segment (from A to D) is known, say AD, then:

\[

8^2 = AD \times AE

\]

- If the problem states or allows us to find AE, we can proceed to calculate.

Key takeaway:

This problem emphasizes the application of the Power of a Point theorem, a vital concept in circle geometry.

Problem Type 2: Proving Tangency or Congruency

Sample Problem:

Prove that the tangents from an external point to a circle are equal in length, using a diagram where two tangents are drawn from point P to circle O.

Solution Approach:

- Draw the two tangents PA and PB from P to the circle at points A and B.
- Connect points A and B, and draw the radii OA and OB to the points of tangency.
- Use the properties that radii are perpendicular to tangent lines at their points of contact.

Step-by-Step Solution:

- Draw the circle with center O, and tangents PA and PB from P.
- Since OA and OB are radii, and the tangents are perpendicular to the radii at points A and B,

$$
OA \perp PA,\quad OB \perp PB
$$

- Consider triangles OAP and OBP. Both are right-angled at A and B respectively.
- Since OA = OB (radii of the same circle), and angles at A and B are right angles, triangles OAP and OBP are congruent by RHS criteria.
- Therefore, PA = PB, proving the tangents from an external point are equal.

Key takeaway:

This proof reinforces properties of tangents and the congruence of triangles, foundational in circle theorems.

Problem Type 3: Applying theorems related to inscribed angles and arcs

Sample Problem:

In a circle, an inscribed triangle ABC has an arc AB measuring 100°. Find the measure of angle ACB.

Solution Approach:

- Recall that the measure of an inscribed angle is half the measure of the intercepted arc.
- Angle ACB is inscribed and intercepts arc AB.

Step-by-Step Solution:

- Since inscribed angle ACB intercepts arc AB,

$$
\angle ACB = \frac{1}{2} \times \text{measure of arc AB}
$$

- Given arc AB measures 100°,

$$
\angle ACB = \frac{1}{2} \times 100° = 50°
$$

Key takeaway:

Understanding the relationship between inscribed angles and intercepted arcs is critical in solving such problems.

Using Coordinate Geometry to Solve Complex Problems

Some problems in pages 347 to 355 involve algebraic methods, especially when geometric figures are placed on coordinate axes.

Example Problem: Coordinates and Equation of a Circle

Problem:

Find the equation of a circle with center at (3, 4) passing through the point (7, 8).

Solution Approach:

- Use the standard form of the circle equation:

$$
(x - h)^2 + (y - k)^2 = r^2
$$

- Calculate the radius (r) using the distance formula between the center and the point.

Step-by-Step Solution:

- Center: $(h, k) = (3, 4)$
- Point on the circle: $(x_1, y_1) = (7, 8)$
- Calculate r:

$$
r = \sqrt{(7 - 3)^2 + (8 - 4)^2} = \sqrt{4^2 + 4^2} = \sqrt{16 + 16} = \sqrt{32} = 4\sqrt{2}
$$

- Equation of the circle:

$$
(x - 3)^2 + (y - 4)^2 = (4\sqrt{2})^2 = 32
$$

Result:

$$
\boxed{(x - 3)^2 + (y - 4)^2 = 32}
$$

Key takeaway:

Coordinate geometry provides an efficient way to solve problems involving circles, especially when specific points are known.
